

FUE HAIR TRANSPLANTATION

Follicular Unit Extraction (FUE) hair transplantation is the most modern and effective hair removal method.

The benefit for you of a FUE hair transplantation over outdated methods is very clear, a perfectly natural-looking donor area.

This is the section where the hair will remove and will later be used in the baldness area.

Each of your follicular units remove individually and normally contain 2 or 3 grafts.

With systematic removal, your natural hair density can be preserved.

DHI TECHNIQUE

The DHI hair transplant technique (Direct Hair Implantation) is the most modern technique to transplant hair.

Benefit from the shortest healing phase and watch your hair grow after just a few days!

What is unique is that no separate channel opening is required in the receiver area and bleeding is nearly zero.

With the help of a special implantation pen, named Choi pen, the previously removed grafts will transplant directly into your baldness area during the treatment – accurately and hassle free.

Choi pen has a small needle at its tip into which the removed grafts will inserted individually.

The hair follicles will then implant in your bald spots at an angle of 40 to 45 degrees – providing a perfectly natural growth direction for your transplanted grafts.

DHI is mostly suitable for small areas of baldnesses.

THE DHI TECHNIQUE

- 🕒 Grafts will be implanted directly without lengthy separation from nutrients
- 🕒 Very high growth rate
- 🕒 Maximum hair density in the recipient area
- 🕒 Fast follow-up phase
- 🕒 Only shaving the donor area.
- 🕒 Return to daily routine after a short time
- 🕒 Natural direction of growth
- 🕒 Perfect end result in both men and women

CHOI-Pen

Your grafts are inserted individually into the special Choi pen by our experts.
